ASSEM MERZOUG

Automation & Systems Engineering — Internship

assemmerzoug@proton.me · github.com/ASSEMMERZOUG · linkedin.com/in/assemmerzoug · assemmerzoug.github.io/Portfolio

PROFILE

Electrical engineering graduate, now studying Automation and Systems Engineering at the University of Palermo. My work sits where control systems meet software: modelling a physical system, scripting the measurement and the report, and testing the result until the assumptions show themselves.

SKILLS

Systems and control. Three-phase inverter modelling, Space Vector PWM, simulation of power electronics.

Programming. Python for modelling, data handling and tooling; Bash and PowerShell for environment automation.

Environments. Linux and Windows administration, Vagrant and VirtualBox for reproducible test machines, Git for version control.

Testing. Turning a physical or software system into a set of checks that either pass or produce evidence of why they did not.

SELECTED WORK

Three-phase inverter —SVPWM

Bachelor's final project: modelling and simulating a three-phase voltage inverter using Space Vector PWM, including the modulation logic and the simulated output waveforms.

pdfsmith —a report engine in plain Python

A zero-dependency library that turns structured findings into a finished PDF. Demonstrates the same habit the role needs: take a repetitive engineering output and automate it properly.

Active Directory lab as code

A Windows domain defined in a Vagrantfile with PowerShell provisioning —infrastructure written down and rebuilt on demand rather than configured by hand.

EDUCATION

MSc Automation & Systems Engineering —University of Palermo

In progress.

BSc Electrical Engineering

Final project: three-phase inverter with Space Vector PWM.

CERTIFICATIONS IN PROGRESS

Security certification work (BSCP, CWES) alongside the degree; OSCP as the long-term target.
